"Western Treasure -- Deep, Wet Snow"

FEDERAL-STATE COOPERATIVE
SNOW SURVEYS AND IRRIGATION WATER FORECASTS

for

# RIO GRANDE DRAINAGE BASIN

MARCH 1, 1948

By

Division of Irrigation, Soil Conservation Service
United States Department of Agriculture
and
Colorado Agricultural Experiment Station

Data included in this report were obtained by the agencies named above in cooperation with the U. S. Forest Service, National Park Service, State Engineers of Colorado and New Mexico and other Federal, State and local organizations.

# March 1, 1948

## Water Supply Outlook

# Rio Grande and Canadian Drainage Basins

The water supply outlook for irrigated areas served by the Rio Grande and its tributaries is well above normal for the first time in the past two seasons. Water content of the snow is nearly 25 percent above the past 11-year average. San Luis Valley is snow covered and this condition extends into northern New Mexico. Soil moisture conditions are good over the watershed. Reservoir storage is low on the Chama River and lower Rio Grande and about average in Colorado. Favorable snow conditions exist on the headwaters of the Pecos and Canadian Rivers, but snow measurements on the Chama and Conejos Rivers indicate the possibility of below normal water supply on these streams.

### RIO GRANDE

The increase in snow cover during the month of February on the mountains surrounding San Luis Valley was much above average. For the main stem of the Rio Grande above Del Norte the water stored in snow is 77 percent over normal and twice as great as March 1, 1947. This favorable snow storage condition includes the watershed of the Alampsa river, but on the Conejos river a slight deficiency is indicated. At Cumbres Pass the water content of the snow was measured at 12.3 inches as compared to an average of 19.4. Snow cover on streams originating in the mountains to the north and east of the valley is about 25 percent above normal. Soil moisture is reported as good and stream flow above average, Reservoir storage in the valley is twice as much as a year ago.

In northern New Mexico along the Rio Grande the snow cover is just above normal and up to 25 percent over March 1, 1947. In contrast to a year ago precipitation at lower elevation is much above normal and soil moisture is reported as good. February precipitation at Albuquerque is a maximum of record. On the Chama River there is a slight deficiency in snow cover at higher elevations. Storagesin El Vado is very low, about five percent of capacity.

The combined storage in Elephant Butte and Caballo reservoirs is down to 565,000 acre-feet as compared to 833,000 a year ago and 1,337,000 on March 1, 1946. However, precipitation in the lower Rio Grande Valley has been above normal and the prospective summer flow is much improved over last year,

On the headwaters of the Pecos near Santa Fe snow water content is nearly three times that of March 1, 1947 and 33 percent above normal. Precipitation in this area has been slightly above normal.

### CANADIAN PIVER

On the tributaries to the Canadian River the water stored in snow is now 36 percent above last year and 20 percent above normal. Conchas reservoir has in storage 353,000 acre-feet. A year ago it stored 366,800. Precipitation during February was nearly four times normal. Soil moisture and crop conditions in the Tucumcari area are reported as good.
